1 HSM API

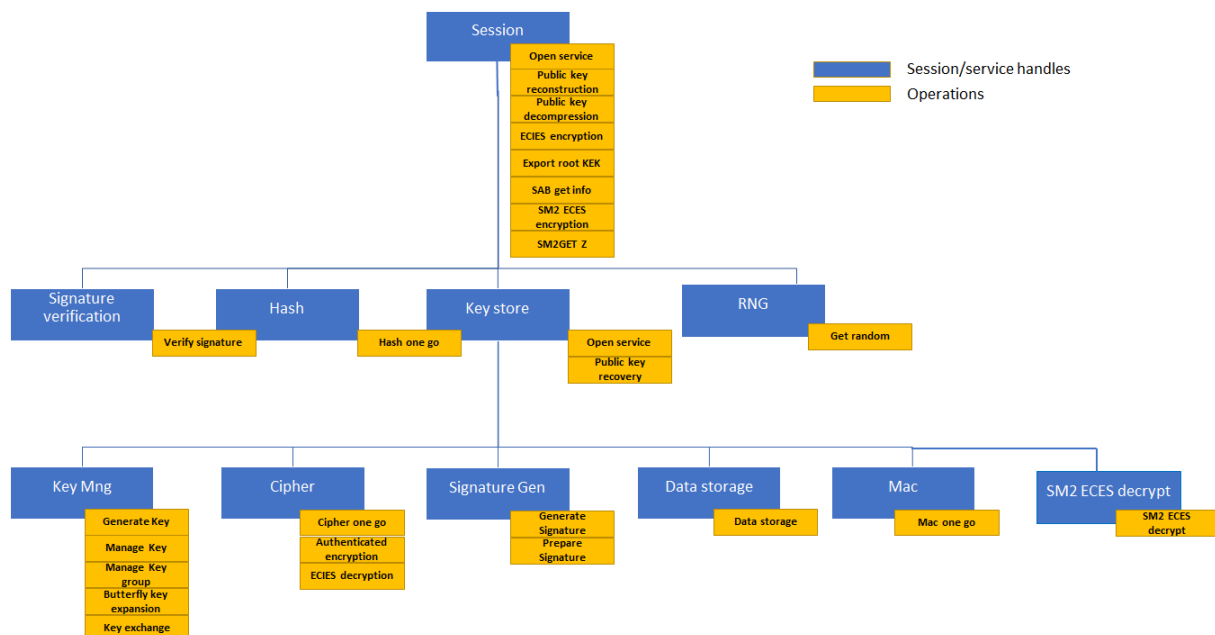

This document is a software reference description of the API provided by the i.MX8 HSM solutions.

2 Revision History

Revision	date	description
0.1 -	Mar 29 2019	Preliminary draft
0.8 -	May 24 2019	It adds the following API: -signature generation -signature verification -rng -hash -butterfly key expansion -ECIES enc/dec -public key reconstruction -public key decompression
0.9 -	May 28 2019	Explicit addresses are replaced by pointers.
1.0 -	May 29 2019	- bug/typos fix. - Change HSM_SVC_KEY_STORE_FLAGS definition
1.1 -	July 31 2019	- hsm_butterfly_key_expansion argument definition: dest_key_↔ identifier is now a pointer. - add error code definition. - improve argument comments clarity
1.5 -	Sept 13 2019	- manage key argument: fix padding size - butterfly key expansion: change argument definition - introduce public key recovery API
1.6 -	Oct 14 2019	- add Key store section in chapter 3 - change key_info and flags definition, substitute key_type_ext with group_id - hsm_generate_key, hsm_manage_key, hsm_butterfly_key_↔ expansion: change argument definition - hsm_manage_key: change argument definition - add hsm_manage_key_group API
1.7 -	Dec 20 2019	- add generic data storage API - add GCM and CMAC support - add support for AES 192/256 key size for all cipher algorithms - add root KEK export API - add key import functionality - add get info API

2.0 -	Feb 21 2020	<ul style="list-style-type: none"> - fix HSM_KEY_INFO_TRANSIENT definition: delete erroneous "not supported" comment - add Key Encryption Key (HSM_KEY_INFO_KEK) support - key store open service API: adding signed message support for key store reprovisionning - naming consistency: remove "hsm_" prefix from <ul style="list-style-type: none"> hsm_op_ecies_dec_args_t hsm_op_pub_key_rec_args_t hsm_op_pub_key_dec_args_t hsm_op_ecies_enc_args_t hsm_op_pub_key_recovery_args_t hsm_op_get_info_args_t
2.1 - subject to change	Apr 16 2020	- Preliminary version: Add the support of the chinese algorithms and update for i.MX8DXL

3 General concepts related to the API

3.1 Session

The API must be initialized by a potential requestor by opening a session.

The session establishes a route (MU, DomainID...) between the requestor and the HSM. When a session is opened, the HSM returns a handle identifying the session to the requestor.

3.2 Service flow

For a given category of services, the requestor is expected to open a service flow by invoking the appropriate HSM API.

The session handle, as well as the control data needed for the service flow, are provided as parameters of the call. Upon reception of the open request, the HSM allocates a context in which the session handle, as well as the provided control parameters are stored and return a handle identifying the service flow.

The context is preserved until the service flow, or the session, are closed by the user and it is used by the HSM to proceed with the sub-sequent operations requested by the user on the service flow.

3.3 Example

```

/* Open a session: create a route between the user and the HSM */
hsm_open_session(&open_session_args, &session_hdl);

/* Open a key store - user is authenticated */
hsm_open_key_store_service(session_hdl, &open_svc_key_store_args, &key_store_hdl);
/* Open hash service - it grants access to hashing operations */
hsm_open_hash_service (session_hdl, &open_svc_hash_args, &hash_hdl);
/* Open cipher service - it grants access to ciphering operations */
hsm_open_cipher_service(key_store_hdl, &open_svc_cipher_args, &cipher_hdl);

/* Perform AES ECB, CCB ... */
hsm_cipher_one_go (cipher_hdl, &op_cipher_one_go_args);
/* Perform authenticate and encryption algos: e.g AES GCM */
hsm_auth_enc (cipher_hdl, &op_auth_enc_args);
/* Perform hashing operations: e.g SHA */
hsm_hash_one_go (hash_hdl, &op_hash_one_go_args);

/* Close the session and all the related services */
hsm_close_session(session_hdl);

```

3.4 Key store

A key store can be created by specifying the CREATE flag in the hsm_open_key_store_service API. Please note that the created key store will be not stored in the NVM till a key is generated/imported specifying the "STRICT OPERATION" flag.

Only symmetric and private keys are stored into the key store. Public keys can be exported during the key pair generation operation or recalculated through the hsm_pub_key_recovery API.

Secret keys cannot be exported under any circumstances, while they can be imported in encrypted form.

3.4.1 Key management

Keys are divided in groups, keys belonging to the same group are written/read from the NVM as a monolithic block. Up to 3 key groups can be handled in the HSM local memory (those immediately available to perform crypto operation), while up to 1024 key groups can be handled in the external NVM and imported in the local memory as needed. If the local memory is full (3 key groups already reside in the HSM local memory) and a new key group is needed by an incoming user request, the HSM swaps one of the local key group with the one needed by the user request. The user can control which key group must be kept in the local memory (cached) through the manage_key_group API lock/unlock mechanism.

As general concept, frequently used keys should be kept, when possible, in the same key group and locked in the local memory for performance optimization.

3.4.2 NVM writing

All the APIs modifying the content of the key store (key generation, key_management, key derivation functions) provide a "STRICT OPERATION" flag. If the flag is set, the HSM triggers and export of the encrypted key group into the external NVM and increments (blows one bit) the OTP monotonic counter used as roll back protection. Please note that the "STRICT OPERATION" has effect only on the current key group.

Any update to the key store must be considered as effective only after an operation specifying the flag "STRICT OPERATION" is acknowledged by the HSM. All the operations not specifying the "STRICT OPERATION" flags impact the HSM local memory only and will be lost in case of system reset

Due to the limited monotonic counter size (QXPB0 up to 1620 update available by default), the user should, when possible, perform multiple updates before setting the "STRICT OPERATION" flag (i.e. keys to be updated should be kept in the same key group).

Once the monotonic counter is completely blown a warning is returned on each update operation to inform the user that the new updates are not roll-back protected.

3.5 implementation specificities

HSM API is supported on different versions of the i.MX8 family. The API description below is the same for all of them but some features may not be available on some chips. The details of the supported features per chip can be found here:

5.1.1 Detailed Description

5.1.2 Enumeration Type Documentation

5.1.2.1 enum hsm_err_t

Error codes returned by HSM functions.

Enumerator

HSM_NO_ERROR Success.

HSM_INVALID_MESSAGE The received message is invalid or unknown.

HSM_INVALID_ADDRESS The provided address is invalid or doesn't respect the API requirements.

HSM_UNKNOWN_ID The provided identifier is not known.

HSM_INVALID_PARAM One of the parameter provided in the command is invalid.

HSM_NVM_ERROR NVM generic issue.

HSM_OUT_OF_MEMORY There is not enough memory to handle the requested operation.

HSM_UNKNOWN_HANDLE Unknown session/service handle.

HSM_UNKNOWN_KEY_STORE The key store identified by the provided "key store Id" doesn't exist and the "create" flag is not set.

HSM_KEY_STORE_AUTH Key store authentication fails.

HSM_KEY_STORE_ERROR An error occurred in the key store internal processing.

HSM_ID_CONFLICT An element (key store, key. ...) with the provided ID already exists.

HSM_RNG_NOT_STARTED The internal RNG is not started.

HSM_CMD_NOT_SUPPORTED The functionality is not supported for the current session/service/key store configuration.

HSM_INVALID_LIFECYCLE Invalid lifecycle for requested operation.

HSM_KEY_STORE_CONFLICT A key store with the same attributes already exists.

HSM_KEY_STORE_COUNTER The current key store reaches the max number of monotonic counter updates, updates are still allowed but monotonic counter will not be blown.

HSM_FEATURE_NOT_SUPPORTED The requested feature is not supported by the firmware.

HSM_GENERAL_ERROR Error not covered by other codes occurred.

Data Structures

- struct [open_session_args_t](#)

Macros

- #define [HSM_OPEN_SESSION_PRIORITY_LOW](#) (0x00U)
Low priority. Should be the default setting on platforms that doesn't support sessions priorities.
- #define [HSM_OPEN_SESSION_PRIORITY_HIGH](#) (0x01U)
High Priority session.
- #define [HSM_OPEN_SESSION_FIPS_MODE_MASK](#) (1u << 0)
Only FIPS certified operations authorized in this session.
- #define [HSM_OPEN_SESSION_EXCLUSIVE_MASK](#) (1u << 1)
No other HSM session will be authorized on the same security enclave.
- #define [HSM_OPEN_SESSION_LOW_LATENCY_MASK](#) (1u << 3)
Use a low latency HSM implementation.
- #define [HSM_OPEN_SESSION_NO_KEY_STORE_MASK](#) (1u << 4)
No key store will be attached to this session. May provide better performances on some operation depending on the implementation. Usage of the session will be restricted to operations that doesn't involve secret keys (e.g. hash, signature verification, random generation).
- #define [HSM_OPEN_SESSION_RESERVED_MASK](#) ((1u << 2) | (1u << 5) | (1u << 6) | (1u << 7))
Bits reserved for future use. Should be set to 0.

5.2.1 Detailed Description

The API must be initialized by a potential requestor by opening a session.
Once a session is closed all the associated service flows are closed by the HSM.

5.2.2 Data Structure Documentation

5.2.2.1 struct open_session_args_t

Data Fields

uint8↔ _t	session_priority	Priority of the operations performed in this session. */.
uint8↔ _t	operating_mode	Options for the session to be opened (bitfield). */.
uint16↔ _t	reserved	

5.2.3 Function Documentation

5.2.3.1 hsm_err_t hsm_open_session (open_session_args_t * args, hsm_hdl_t * session_hdl)

Parameters

args	pointer to the structure containing the function arguments.
session_hdl	pointer to where the session handle must be written.

Returns

error_code error code.

5.2.3.2 hsm_err_t hsm_close_session (hsm_hdl_t session_hdl)

Terminate a previously opened session. All the services opened under this session are closed as well

Parameters

session_hdl	pointer to the handle identifying the session to be closed.
-------------	-------------------------------------------------------------

Returns

error_code error code.

5.3 Key store

Modules

- [i.MX8QXP specificities](#)

Data Structures

- struct [open_svc_key_store_args_t](#)

Macros

- #define [HSM_SVC_KEY_STORE_FLAGS_CREATE](#) ((hsm_svc_key_store_flags_t)(1u << 0))
It must be specified to create a new key store. The key store will be stored in the NVM only once a key is generated/imported specifying the STRICT OPERATION flag.
- #define [HSM_SVC_KEY_STORE_FLAGS_UPDATE](#) ((hsm_svc_key_store_flags_t)(1u << 2))
It must be specified in order to open a key management service flow.
- #define [HSM_SVC_KEY_STORE_FLAGS_DELETE](#) ((hsm_svc_key_store_flags_t)(1u << 3))
It must be specified to delete an existing key store.

Typedefs

- typedef uint8_t [hsm_svc_key_store_flags_t](#)

Functions

- [hsm_err_t hsm_open_key_store_service](#) (hsm_hdl_t session_hdl, [open_svc_key_store_args_t](#) *args, hsm_hdl_t *key_store_hdl)
- [hsm_err_t hsm_close_key_store_service](#) (hsm_hdl_t key_store_hdl)

5.3.1 Detailed Description

User must open a key store service flow in order to perform the following operations:

- create a new key store
- perform operations involving keys stored in the key store (ciphering, signature generation...)
- perform a key store reprovisioning using a signed message. A key store re-provisioning results in erasing all the key stores handled by the HSM.

To grant access to the key store, the caller is authenticated against the domain ID (DID) and Messaging Unit used at the keystore creation, additionally an authentication nonce can be provided.

5.3.2 Data Structure Documentation

5.3.2.1 struct open_svc_key_store_args_t

Data Fields

uint32_t	key_store_identifier	user defined id identifying the key store. Only one key store service can be opened on a given key_store_identifier.
uint32_t	authentication_nonce	user defined nonce used as authentication proof for accesing the key store.
uint16_t	max_updates_number	maximum number of updates authorized for the key store. Valid only for create operation. This parameter has the goal to limit the occupation of the monotonic counter used as anti-rollback protection. If the maximum number of updates is reached, HSM still allows key store updates but without updating the monotonic counter giving the opportunity for rollback attacks.
hsm_svc_key_store_↔ flags_t	flags	bitmap specifying the services properties.
uint8_t	reserved	
uint8_t *	signed_message	pointer to signed_message to be sent only in case of key store re-provisioning
uint16_t	signed_msg_size	size of the signed_message to be sent only in case of key store re-provisioning
uint8_t	reserved_1[2]	

5.3.3 Function Documentation

5.3.3.1 **hsm_err_t** hsm_open_key_store_service (**hsm_hdl_t** session_hdl, **open_svc_key_store_args_t** * args, **hsm_hdl_t** * key_store_hdl)

Open a service flow on the specified key store. Only one key store service can be opened on a given key store.

Parameters

session_hdl	pointer to the handle identifying the current session.
args	pointer to the structure containing the function arguments.
key_store_hdl	pointer to where the key store service flow handle must be written.

Returns

error_code error code.

5.3.3.2 **hsm_err_t** hsm_close_key_store_service (**hsm_hdl_t** key_store_hdl)

Close a previously opened key store service flow. The key store is deleted from the HSM local memory, any update not written in the NVM is lost

Parameters

handle	identifying the key store service flow to be closed.
--------	------------------------------------------------------

Returns

`error_code` error code.

- #define **HSM_KEY_TYPE_SM4_128** ((hsm_key_type_t)0x50u)
- #define **HSM_OP_KEY_GENERATION_FLAGS_UPDATE** ((hsm_op_key_gen_flags_t)(1u << 0))
User can replace an existing key only by generating a key with the same type of the original one.
- #define **HSM_OP_KEY_GENERATION_FLAGS_CREATE** ((hsm_op_key_gen_flags_t)(1u << 1))
Create a new key.
- #define **HSM_OP_KEY_GENERATION_FLAGS_STRICT_OPERATION** ((hsm_op_key_gen_flags_t)(1u << 7))
The request is completed only when the new key has been written in the NVM. This applicable for persistent key only.
- #define **HSM_KEY_INFO_PERSISTENT** ((hsm_key_info_t)(0u << 1))
Persistent keys are stored in the external NVM. The entire key group is written in the NVM at the next STRICT operation.
- #define **HSM_KEY_INFO_PERMANENT** ((hsm_key_info_t)(1u << 0))
When set, the key is permanent (write locked). Once created, it will not be possible to update or delete the key anymore. Transient keys will be anyway deleted after a PoR or when the corresponding key store service flow is closed. This bit can never be reset.
- #define **HSM_KEY_INFO_TRANSIENT** ((hsm_key_info_t)(1u << 1))
Transient keys are deleted when the corresponding key store service flow is closed or after a PoR. Transient keys cannot be in the same key group than persistent keys.
- #define **HSM_KEY_INFO_MASTER** ((hsm_key_info_t)(1u << 2))

When set, the key is considered as a master key. Only master keys can be used as input of key derivation functions (i.e butterfly key expansion).

- #define `HSM_KEY_INFO_KEK` ((hsm_key_info_t)(1u << 3))

When set, the key is considered as a key encryption key. KEK keys can only be used to wrap and import other keys into the key store, all other operation are not allowed. Only keys imported in the key store through the hsm_manage_key API can get this attribute.

- #define `HSM_OP_MANAGE_KEY_FLAGS_IMPORT_UPDATE` ((hsm_op_manage_key_flags_t)(1u << 0))

User can replace an existing key only by importing a key with the same type of the original one.

- #define `HSM_OP_MANAGE_KEY_FLAGS_IMPORT_CREATE` ((hsm_op_manage_key_flags_t)(1u << 1))

Import a key and create a new identifier.

- #define `HSM_OP_MANAGE_KEY_FLAGS_DELETE` ((hsm_op_manage_key_flags_t)(1u << 2))

Delete an existing key.

- #define `HSM_OP_MANAGE_KEY_FLAGS_PART_UNIQUE_ROOT_KEK` ((hsm_op_manage_key_flags_t)(1u << 3))

The key to be imported is encrypted using the part-unique root kek.

- #define `HSM_OP_MANAGE_KEY_FLAGS_COMMON_ROOT_KEK` ((hsm_op_manage_key_flags_t)(1u << 4))

The key to be imported is encrypted using the common root kek.

- #define `HSM_OP_MANAGE_KEY_FLAGS_STRICT_OPERATION` ((hsm_op_manage_key_flags_t)(1u << 7))

The request is completed only when the new key has been written in the NVM. This is only applicable for persistent key.

- #define `HSM_OP_MANAGE_KEY_GROUP_FLAGS_CACHE_LOCKDOWN` ((hsm_op_manage_key_group_flags_t)(1u << 0))

The entire key group will be cached in the HSM local memory.

HSM may export the key group in the external NVM to free up the local memory. HSM will copy the key group in the local memory again in case of key group usage/update.

- #define `HSM_OP_MANAGE_KEY_GROUP_FLAGS_DELETE` ((hsm_op_manage_key_group_flags_t)(1u << 2))

Delete an existing key group.

- #define `HSM_OP_MANAGE_KEY_GROUP_FLAGS_STRICT_OPERATION` ((hsm_op_manage_key_group_flags_t)(1u << 7))

The request is completed only when the update has been written in the NVM. Not applicable for cache lock-down/unlock.

- #define `HSM_OP_BUTTERFLY_KEY_FLAGS_UPDATE` ((hsm_op_but_key_exp_flags_t)(1u << 0))

User can replace an existing key only by generating a key with the same type of the original one.

- #define `HSM_OP_BUTTERFLY_KEY_FLAGS_CREATE` ((hsm_op_but_key_exp_flags_t)(1u << 1))

Create a new key.

- #define `HSM_OP_BUTTERFLY_KEY_FLAGS_IMPLICIT_CERTIF` ((hsm_op_but_key_exp_flags_t)(0u << 2))

butterfly key expansion using implicit certificate.

- #define `HSM_OP_BUTTERFLY_KEY_FLAGS_EXPLICIT_CERTIF` ((hsm_op_but_key_exp_flags_t)(1u << 2))

butterfly key expansion using explicit certificate.

5.4.1 Detailed Description

5.4.2 Data Structure Documentation

5.4.2.1 struct open_svc_key_management_args_t

Data Fields

hsm_svc_key_management_↔ flags_t	flags	bitmap specifying the services properties.
uint8_t	reserved[3]	

5.4.2.2 struct op_generate_key_args_t

Data Fields

uint32_t *	key_identifier	pointer to the identifier of the key to be used for the operation. In case of create operation the new key identifier will be stored in this location.
uint16_t	out_size	length in bytes of the generated key. It must be 0 in case of symmetric keys.
hsm_op_key_gen_↔ flags_t	flags	bitmap specifying the operation properties.
hsm_key_type_t	key_type	indicates which type of key must be generated.
hsm_key_group_t	key_group	Key group of the generated key, relevant only in case of create operation. it must be a value in the range 0-1023. Keys belonging to the same group can be cached in the HSM local memory through the hsm_manage_key_group API.

Data Fields

hsm_key_info_t	key_info	bitmap specifying the properties of the key.
uint8_t *	out_key	pointer to the output area where the generated public key must be written.

5.4.2.3 struct op_manage_key_args_t

Data Fields

uint32_t *	key_identifier	pointer to the identifier of the key to be used for the operation. In case of create operation the new key identifier will be stored in this location.
uint32_t	kek_identifier	identifier of the key to be used to decrypt the key to be imported (Key Encryption Key), only AES-256 key can be used as KEK. It must be 0 if the HSM_OP_MANAGE_KEY↔_FLAGS_PART_UNIQUE_ROOT_KEK or HSM_OP_MANAGE_KEY_FLAGS_COMMON_ROOT_KEK flags are set.
uint16_t	input_size	length in bytes of the input key area. It must be equal to the length of the IV (12 bytes) + ciphertext + Tag (16 bytes). It must be 0 in case of delete operation.
hsm_op_manage_key↔_flags_t	flags	bitmap specifying the operation properties.
hsm_key_type_t	key_type	indicates the type of the key to be managed.
hsm_key_group_t	key_group	key group of the imported key, only relevant in case of create operation (it must be 0 otherwise). It must be a value in the range 0-1023. Keys belonging to the same group can be cached in the HSM local memory through the hsm_manage_key_group API.
hsm_key_info_t	key_info	bitmap specifying the properties of the key, in case of update operation it will replace the existing value. It must be 0 in case of delete operation.
uint8_t *	input_data	pointer to the input buffer. The input buffer is the concatenation of the IV, the encrypted key to be imported and the tag. It must be 0 in case of delete operation.

5.4.2.4 struct op_manage_key_group_args_t

Data Fields

hsm_key_group_t	key_group	it must be a value in the range 0-1023. Keys belonging to the same group can be cached in the HSM local memory through the hsm_manage_key_group API.
hsm_op_manage_key_group↔_flags_t	flags	bitmap specifying the operation properties.
uint8_t	reserved	

5.4.2.5 struct op_but_key_exp_args_t

Data Fields

uint32_t	key_identifier	identifier of the key to be expanded.
uint8_t *	expansion_function_value	pointer to the expansion function value input
uint8_t *	hash_value	pointer to the hash value input. In case of explicit certificate, the hash value address must be set to 0.
uint8_t *	pr_reconstruction_value	pointer to the private reconstruction value input. In case of explicit certificate, the pr_reconstruction_value address must be set to 0.
uint8_t	expansion_function_value_size	length in bytes of the expansion function input
uint8_t	hash_value_size	length in bytes of the hash value input. In case of explicit certificate, the hash_value_size parameter must be set to 0.
uint8_t	pr_reconstruction_value_size	length in bytes of the private reconstruction value input. In case of explicit certificate, the pr_reconstruction_value_size parameter must be set to 0.
hsm_op_but_key_exp ↔ flags_t	flags	bitmap specifying the operation properties
uint32_t *	dest_key_identifier	pointer to identifier of the derived key to be used for the operation. In case of create operation the new destination key identifier will be stored in this location.
uint8_t *	output	pointer to the output area where the public key must be written.
uint16_t	output_size	length in bytes of the generated key, if the size is 0, no key is copied in the output.
hsm_key_type_t	key_type	indicates the type of the key to be derived.
uint8_t	reserved	
hsm_key_group_t	key_group	it must be a value in the range 0-1023. Keys belonging to the same group can be cached in the HSM local memory through the hsm_manage_key_group API
hsm_key_info_t	key_info	bitmap specifying the properties of the derived key.

5.4.3 Function Documentation

5.4.3.1 **hsm_err_t hsm_open_key_management_service (hsm_hdl_t key_store_hdl, open_svc_key_management_↔ args_t * args, hsm_hdl_t * key_management_hdl)**

Open a key management service flow

User must open this service flow in order to perform operation on the key store keys (generate, update, delete)

Parameters

key_store_hdl	handle identifying the key store service flow.
args	pointer to the structure containing the function arguments.
key_management_hdl	pointer to where the key management service flow handle must be written.

Returns

error_code error code.

5.4.3.2 hsm_err_t hsm_generate_key (hsm_hdl_t key_management_hdl, op_generate_key_args_t * args)

Generate a key or a key pair. Only the confidential keys (symmetric and private keys) are stored in the internal key store, while the non-confidential keys (public key) are exported.

The generated key can be stored using a new or existing key identifier with the restriction that an existing key can be replaced only by a key of the same type.

User can call this function only after having opened a key management service flow.

Parameters

<i>key_management_hdl</i>	handle identifying the key management service flow.
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.4.3.3 hsm_err_t hsm_manage_key (hsm_hdl_t key_management_hdl, op_manage_key_args_t * args)

This command is designed to perform the following operations:

- import a key creating a new key identifier (import and create)
- import a key using an existing key identifier (import and update)
- delete an existing key

The key encryption key (KEK) can be previously pre-shared or stored in the key store.

The key to be imported must be encrypted by using the KEK as following:

- Algorithm: AES GCM
- Key: root KEK
- AAD = 0
- IV = 12 bytes
- Tag = 16 bytes
- Plaintext: key to be imported

User can call this function only after having opened a key management service flow

Parameters

<i>key_management_hdl</i>	handle identifying the key management service flow.
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.4.3.4 `hsm_err_t hsm_manage_key_group (hsm_hdl_t key_management_hdl, op_manage_key_group_args_t * args)`

This command is designed to perform the following operations:

- lock/unlock down a key group in the HSM local memory so that the keys are available to the HSM without additional latency
- un-lock a key group. HSM may export the key group into the external NVM to free up local memory as needed
- delete an existing key group

User can call this function only after having opened a key management service flow.

Parameters

<i>key_management_hdl</i>	handle identifying the key management service flow.
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.4.3.5 `hsm_err_t hsm_butterfly_key_expansion (hsm_hdl_t key_management_hdl, op_butt_key_exp_args_t * args)`

This command is designed to perform the butterfly key expansion operation on an ECC private key in case of implicit and explicit certificates. Optionally the resulting public key is exported.

The result of the key expansion function f_k is calculated outside the HSM and passed as input. The expansion function is defined as $f_k = f_{k_int} \bmod I$, where I is the order of the group of points on the curve.

User can call this function only after having opened a key management service flow.

Explicit certificates:

- f_k = expansion function value

$out_key = Key + f_k$

Implicit certificates:

- f_k = expansion function value,
- hash = hash value used in the derivation of the pseudonym ECC key,
- pr_v = private reconstruction value

$out_key = (Key + f_k) * hash + pr_v$

Parameters

<i>key_management_hdl</i>	handle identifying the key store management service flow.
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.4.3.6 `hsm_err_t hsm_close_key_management_service (hsm_hdl_t key_management_hdl)`

Terminate a previously opened key management service flow

Parameters

<i>key_management_hdl</i>	handle identifying the key management service flow.
---------------------------	-----------------------------------------------------

Returns

error code

5.5.3.1 hsm_err_t hsm_open_cipher_service (hsm_hdl_t key_store_hdl, open_svc_cipher_args_t * args, hsm_hdl_t * cipher_hdl)

Open a cipher service flow

User can call this function only after having opened a key store service flow.

User must open this service in order to perform cipher operation

Parameters

key_store_hdl	handle identifying the key store service flow.
args	pointer to the structure containing the function arguments.
cipher_hdl	pointer to where the cipher service flow handle must be written.

Returns

5.5.3.4 hsm_err_t hsm_ecies_decryption (hsm_hdl_t cipher_hdl, op_ecies_dec_args_t * args)

Decrypt data using ECIES

User can call this function only after having opened a cipher store service flow.

ECIES is supported with the constraints specified in 1609.2-2016.

Parameters

<i>session_hdl</i>	handle identifying the current session.
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.5.3.5 hsm_err_t hsm_close_cipher_service (hsm_hdl_t cipher_hdl)

Terminate a previously opened cipher service flow

Parameters

<i>cipher_hdl</i>	pointer to handle identifying the cipher service flow to be closed.

Terminate a previously opened signature generation service flow

Parameters

<i>signature_gen_hdl</i>	handle identifying the signature generation service flow to be closed.
--------------------------	------------------------------------------------------------------------

Returns

error code

5.6.3.3 `hsm_err_t hsm_generate_signature (hsm_hdl_t signature_gen_hdl, op_generate_sign_args_t * args)`

Generate a digital signature according to the signature scheme

User can call this function only after having opened a signature generation service flow

The signature $S=(r,s)$ is stored in the format $r||s||R_y$ where R_y is an additional byte containing the lsb of y . R_y has to be considered valid only if the `HSM_OP_GENERATE_SIGN_FLAGS_COMPRESSED_POINT` is set.

In case of `HSM_SIGNATURE_SCHEME_DSA_SM2_FP_256_SM3`, message of `op_generate_sign_args_t` should be (as specified in GB/T 32918):

- equal to $Z||M$ in case of `HSM_OP_GENERATE_SIGN_FLAGS_INPUT_MESSAGE`
- equal to $SM3(Z||M)$ in case of `HSM_OP_GENERATE_SIGN_FLAGS_INPUT_DIGEST`

Parameters

<i>signature_gen_hdl</i>	handle identifying the signature generation service flow.
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.6.3.4 `hsm_err_t hsm_prepare_signature (hsm_hdl_t signature_gen_hdl, op_prepare_sign_args_t * args)`

Prepare the creation of a signature by pre-calculating the operations having not dependencies on the input message. The pre-calculated value will be stored internally and used once call `hsm_generate_signature`. User can call this function only after having opened a signature generation service flow. The signature $S=(r,s)$ is stored in the format $r||s||R_y$ where R_y is an additional byte containing the lsb of y , R_y has to be considered valid only if the `HSM_OP_PREPARE_SIGN_COMPRESSED_POINT` is set.

Parameters

<i>signature_gen_hdl</i>	handle identifying the signature generation service flow
<i>args</i>	pointer to the structure containing the function arguments.

Returns

error code

5.7.2.2 struct op_verify_sign_args_t

Data Fields

uint8_t *	key	pointer to the public key to be used for the verification. If the HSM_OP_VERIFY_SIGN_FLAGS_KEY_INTERNAL is set, it must point to the key reference returned by the hsm_import_public_key API.
uint8_t *	message	pointer to the input (message or message digest)
uint8_t *	signature	pointer to the input signature. The signature S=(r,s) is expected to be in the format r s Ry where Ry is an additional byte containing the lsb of y. Ry will be considered as valid only if the HSM_OP_VERIFY_SIGN_FLAGS_COMPRESSED_POINT is set.
uint16_t	key_size	length in bytes of the input key
uint16_t	signature_size	length in bytes of the output - it must contain one additional byte where to store the Ry.
uint32_t	message_size	length in bytes of the input message
hsm_signature_scheme_↔ id_t	scheme_id	identifier of the digital signature scheme to be used for the operation

5.7.3.1 hsm_err_t hsm_open_signature_verification_service (hsm_hdl_t session_hdl, open_svc_sign_ver_args_t * args, hsm_hdl_t * signature_ver_hdl)

User must open this service in order to perform signature verification operations.
User can call this function only after having opened a session.

Parameters

<i>session_hdl</i>	handle identifying the current session.
<i>args</i>	pointer to the structure containing the function arguments.
<i>signature_ver_hdl</i>	pointer to where the signature verification service flow handle must be written.

Returns

error code

5.7.3.2 `hsm_err_t hsm_verify_signature (hsm_hdl_t signature_ver_hdl, op_verify_sign_args_t * args, hsm_verification_status_t * status)`

Verify a digital signature according to the signature scheme

User can call this function only after having opened a signature verification service flow

The signature $S=(r,s)$ is expected to be in format $r||s||R_y$ where R_y is an additional byte containing the lsb of y . R_y will be considered as valid only if the `HSM_OP_VERIFY_SIGN_FLAGS_COMPRESSED_POINT` is set.

Only not-compressed keys (x,y) can be used by this command. Compressed keys can be decompressed by using the dedicated API.

In case of `HSM_SIGNATURE_SCHEME_DSA_SM2_FP_256_SM3`, message of `op_verify_sign_args_t` should be (as specified in GB/T 32918):

- equal to $Z||M$ in case of `HSM_OP_VERIFY_SIGN_FLAGS_INPUT_MESSAGE`
- equal to $SM3(Z||M)$ in case of `HSM_OP_VERIFY_SIGN_FLAGS_INPUT_DIGEST`

Parameters

<i>signature_ver_hdl</i>	handle identifying the signature verification service flow.
<i>args</i>	pointer to the structure containing the function arguments.
<i>status</i>	pointer to where the verification status must be stored if the verification succeed the value <code>HSM_VERIFICATION_STATUS_SUCCESS</code> is returned.

Returns

error code

5.7.3.3 `hsm_err_t hsm_import_public_key (hsm_hdl_t signature_ver_hdl, op_import_public_key_args_t * args, uint32_t * key_ref)`

Import a public key to be used for several verification operations, a reference to the imported key is returned.

User can use the returned reference in the `hsm_verify_signature` API by setting the `HSM_OP_VERIFY_SIGN_FLAGS_KEY_INTERNAL` flag

Only not-compressed keys (x,y) can be imported by this command. Compressed keys can be decompressed by using the dedicated API. User can call this function only after having opened a signature verification service flow.

Parameters

<i>signature_ver_hdl</i>	handle identifying the signature verification service flow.
<i>args</i>	pointer to the structure containing the function arguments.
<i>key_ref</i>	pointer to where the 4 bytes key reference to be used as key in the hsm_verify_signature will be stored

Returns

error code

5.7.3.4 hsm_err_t hsm_close_signature_verification_service (hsm_hdl_t *signature_ver_hdl*)

Terminate a previously opened signature verification service flow

Parameters

<i>signature_ver_hdl</i>	handle identifying the signature verification service flow to be closed.
--------------------------	--------------------------------------------------------------------------

Returns

5.17.3.1 **hsm_err_t hsm_open_mac_service (hsm_hdl_t key_store_hdl, open_svc_mac_args_t * args, hsm_hdl_t * mac_hdl)**

Open a mac service flow

User can call this function only after having opened a key store service flow.

User must open this service in order to perform mac operation

Parameters

<i>key_store_hdl</i>	handle identifying the key store service flow.
<i>args</i>	pointer to the structure containing the function arguments.
<i>mac_hdl</i>	pointer to where the mac service flow handle must be written.

Returns

5.18.3 Function Documentation

5.18.3.1 hsm_err_t hsm_sm2_get_z (hsm_hdl_t session_hdl, op_sm2_get_z_args_t * args)

This command is designed to compute $Z = \text{SM3}(\text{Entl} \parallel \text{ID} \parallel a \parallel b \parallel xG \parallel yG \parallel x\text{pubk} \parallel y\text{pubk})$

- ID, Entl: user distinguishing identifier and length,

- a, b, xG and yG : curve parameters,
- xpubk , ypubk : public key

This value is used for SM2 public key cryptography algorithms, as specified in GB/T 32918. User can call this function only after having opened a session.

Parameters

<i>session_hdl</i>	handle identifying the current session.
<i>args</i>	pointer to the structure containing the function arguments.

Data Fields

uint32_t	key_identifier	identifier of the key used for derivation. It must be zero, if HSM_OP_KEY_EXCHANGE_FLAGS_USE_EPHEMERAL is set.
uint32_t *	shared_key_identifier	pointer to identifier of the derived key In case of create operation the new destination key identifier will be stored in this location.
uint8_t *	ke_input	pointer to the initiator input data related to the key exchange function
uint8_t *	ke_output	pointer to the output area where the data related to the key exchange function must be written. It corresponds to the receiver public data. It must be zero, if HSM_OP_KEY_EXCHANGE_FLAGS_USE_EPHEMERAL is set.
uint8_t *	kdf_input	pointer to the input data of the KDF
uint8_t *	kdf_output	pointer to the output area where the non sensitive output data related to the KDF
hsm_key_group_t	shared_key_group	it must be a value in the range 0-1023. Keys belonging to the same group can be cached in the HSM local memory through the hsm_manage_key_group API
hsm_key_info_t	shared_key_info	bitmap specifying the properties of the derived key.
hsm_key_type_t	shared_key_type	indicates the type of the key to be derived.
hsm_key_type_t	public_data_type	indicates the key type of the initiator and receiver
hsm_key_exchange_scheme_id_t	key_exchange_scheme	indicates the key exchange scheme

5.21.3 Function Documentation

5.21.3.1 hsm_err_t hsm_key_exchange (hsm_hdl_t key_management_hdl, op_key_exchange_args_t * args)

This command is designed to derive a secret key that will be stored in the key store as a new key or as an update of an existing key. For this secret key derivation, we can use, as input, a freshly generated key or an existing key from the key store. User can call this function only after having opened a key management service flow

Parameters

<i>key_management_hdl</i>	handle identifying the key store management service flow.
<i>args</i>	pointer to the structure containing the function arguments.

Returns
