Generate a key or a key pair. Only the confidential keys (symmetric and private keys) are stored in the internal key store, while the non-confidential keys (public key) are exported.

The generated key can be stored using a new or existing key identifier with the restriction that an existing key can be replaced only by a key of the same type.

    op_manage_key_args_t * args )
```

This command is designed to perform the following operations:

- import a key creating a new key identifier

    hsm_hdl_t key_management_hdl,
    op_butt_key_exp_args_t * args )
```

This command is designed to perform the butterfly key expansion operation on an ECC private key in case of implicit and explicit certificates. Optionally the resulting public key is exported.

The result of the key expansion function f_k is calculated outside the HSM and passed as input. The expansion function is defined as $f_k = f_{k_int} \bmod I$

User can call this function only after having opened a key management service flow.

Explicit certificates:

- f_k = expansion function value $out_key = Key + f_k$
